

ABOVE GROUND STORAGE TANKS

Series

These unique tanks provide advantages in unconventional plays for production companies, consultants and water management companies. Our tanks offer a safe, reliable, cost effective and environmentally responsible containment solution.

ONE-DAY SETUP • EASILY MOVED FROM LOCATION TO LOCATION • FOUR TANK SIZES

- Tank sizes ranging from 9,000 - 51,000 bbls
- All tanks equipped with OSHA approved stairs & landing (with handrail)
- 12" Suction capable of handling up to 120 barrels/minute capacity
- Patented panel design for added safety & easy setup; each panel serialized for security & traceability
- Minimal site prep & environmental impact
- Turn-key package & installation

ABOVE GROUND STORAGE TANKS *Series*

Commander Series

manufactured with safety and reliability first. Our above ground storage tanks have been developed to be cost effective versus conventional storage tanks while providing an environmentally responsible containment solution.

Commander Series tanks also offer flexibility in design with four sizes ranging from 9,000 bbls to 51,000 bbls to accommodate the requirements of our customers at any given location with the option for rental or purchase, and can be transported with as little as 2 trucks (depending on size). With a setup time of just one day, Commander Tanks offer a convenient solution for water storage while cutting transportation costs and decreasing heavy truck traffic.

FILL STATIONS

Resource West's Commander Fill Stations were designed as an in-line anchor to aid in the safe, secure transfer of liquids between any liquid storage facility and transport trucks. The main purpose of the Fill Station is to mitigate and minimize the hazards associated with the transfer of liquids and prevent any damage to company assets such as tank/pit liners, wildlife netting, hoses, piping, storage tanks, etc.

In the event an incident does take place, the Fill Station helps prevent damage and fluids release will be limited to the hose connecting the Fill Station to the transport trucks and the amount of liquid in that hose. This stopgap will minimize any potential damage to the storage facility while providing a safer working environment for those using them.

WEATHER PROOFING

To help with heat loss and freezing conditions from the cold weather elements, the Commander Series tank walls can be insulated and an optional insulated cover can be used to minimize potential heat loss — saving time and money in the water heating process.

COMMANDER SERIES™ TANK MONITORING SYSTEM

Resource West Commander Tank Monitoring System consists of a sensor managed by a full-featured remote access and control system with customizable application programs and display menus, a remote communication unit and a web based application. With remote access, the control application gives you the ability to monitor the Commander Series Tank(s) level, volume and temperature anytime, anywhere. Along with the remote access, On-Site monitoring is available through a control panel installed on each tank.
